

A Must-Have California Native Plant!

California Buckwheat

Eriogonum fasciculatum

Description: California Buckwheat blooms for months, and butterflies are attracted to the dense clusters of cream and pink flowers on its large landing pads, aka large flower heads.

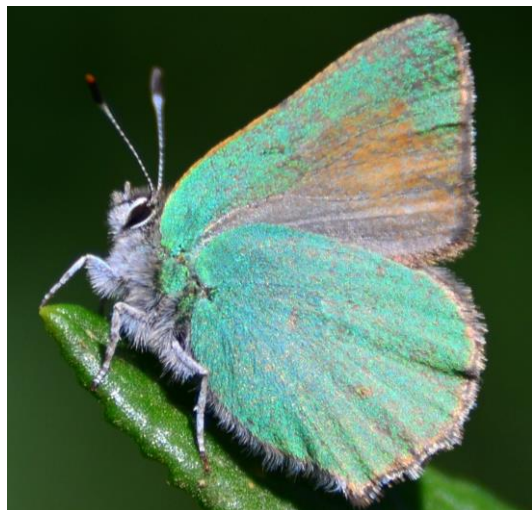

Light: Full Sun

56 species of butterflies and moths can lay eggs on this plant.

Featured Butterfly: When not sipping nectar from our native buckwheat blossoms, the beautiful green **Lotus Hairstreak** butterfly can be seen perching on the ground along pathways. Watch for it from March through May.

Keystone Plant: This California native is a “must have” (host) plant for caterpillars, which, in turn, are the “must have” food for baby birds.
