

A Must-Have California Native Plant!

Coyote Brush

Baccharis pilularis

Description: Coyote Brush is an evergreen, easy care, water-conserving shrub that blooms in fall when most plants have gone dormant. It is a great choice for the garden, providing nectar for pollinators and cover for birds.

Light: Full Sun / Part Shade

37 species of butterflies and moths can lay eggs on this plant.

Featured Moth: The *Salt Marsh Moth* can be seen in the garden from May through August. As a caterpillar, it feeds on coyote brush, then forms a chrysalis on the ground in the leaves below. You can help them by leaving the leaves in your garden!

Keystone Plant: This California native is a “must have” (host) plant for caterpillars, which, in turn, are the “must have” food for baby birds.
